

Chapter 2: Differential Calculus

Concept: Limits | The value a function approaches as the input approaches a point | end

Limits is studied by working through example 0 and checking each step carefully. Limits is studied by working through example 1 and checking each step carefully. Limits is studied by working through example 2 and checking each step carefully. Limits is studied by working through example 3 and checking each step carefully. Limits is studied by working through example 4 and checking each step carefully. Limits is studied by working through example 5 and checking each step carefully. Limits is studied by working through example 6 and checking each step carefully. Limits is studied by working through example 7 and checking each step carefully. Limits is studied by working through example 8 and checking each step carefully. Limits is studied by working through example 9 and checking each step carefully. Limits is studied by working through example 10 and checking each step carefully. Limits is studied by working through example 11 and checking each step carefully.

| <b>f(x)</b> | <b>f'(x)</b> |
|-------------|--------------|
| x^2         | 2x           |
| sin x       | cos x        |

Concept: Derivatives | The instantaneous rate of change of a function | requires: Limits | end

Derivatives is studied by working through example 0 and checking each step carefully. Derivatives is studied by working through example 1 and checking each step carefully. Derivatives is studied by working through example 2 and checking each step carefully. Derivatives is studied by working through example 3 and checking each step carefully. Derivatives is studied by working through example 4 and checking each step carefully. Derivatives is studied by working through example 5 and checking each step carefully. Derivatives is studied by working through example 6 and checking each step carefully. Derivatives is studied by working through example 7 and checking each step carefully. Derivatives is studied by working through example 8 and checking each step carefully. Derivatives is studied by working through example 9 and checking each step carefully. Derivatives is studied by working through example 10 and checking each step carefully. Derivatives is studied by working through example 11 and checking each step carefully.

Concept: Chain Rule | How to differentiate a composition of functions | requires: Derivatives | end

Chain Rule is studied by working through example 0 and checking each step carefully. Chain Rule is studied by working through example 1 and checking each step carefully. Chain Rule is studied by working through example 2 and checking each step carefully. Chain Rule is studied by working through example 3 and checking each step carefully. Chain Rule is studied by working through example 4 and checking each step carefully. Chain Rule is studied by working through example 5 and checking each step carefully. Chain Rule is studied by working through example 6 and checking each step carefully. Chain Rule is studied by working through example 7 and checking each step carefully. Chain Rule is studied by working through example 8 and checking each step carefully. Chain Rule is studied by working through example 9 and checking each step carefully. Chain Rule is studied by working through example 10 and checking each step carefully. Chain Rule is studied by working through example 11 and checking each step carefully.
